一、 编写 node 路由,连接后台服务

1. 连接代理

```
const TAF = require('@taf/taf-rpc').Communicator.New();
const Test = require('./UserProxy').Test;

let servant = 'Test.UserZjServer.UserZjObj';
if (!process.env.TAF_CONFIG) {
    servant += '@tcp -h 127.0.0.1 -p 14001 -t 60000';
}
const proxy = TAF.stringToProxy(Test.UserProxy, servant);
exports.Test = Test;
exports.proxy = proxy;
```

2. 编写路由

1) 登录

```
router.post('/loginForAd', (req, res) => {
    const { username, password } = req.body;
    const stReq = new Test.LoginReq();
    stReq.readFromObject({
        username,
        password,
    });
    proxy.loginForAd(stReq).then(ret => {
          jsonWrite(res, ret.response.arguments.stRsp.toObject());
    }, ret => {
        console.log('error');
    });
});
```

2) 添加用户

```
});
proxy.saveUser(stReq).then(ret => {
        jsonWrite(res, ret.response.arguments.stRsp.toObject());
}, ret => {
        console.log('error');
});
});
```

3) 获取用户列表

4) 删除用户

```
// 删除用户
router.get('/delUser', (req, res) => {
    const { uid } = req.query;
    const stReq = new Test.QueryIdReq();
    stReq.readFromObject({
        uid
    });
    proxy.delUser(stReq).then(ret => {
        jsonWrite(res, ret.response.arguments.stRsp.toObject());
    }, ret => {
        console.log('error');
    });
});
```

5) 修改用户

```
// 修改用户
router.post('/updateUser', (req, res) => {
    const { uid, username, password, tel, gender, age } = req.body;
    const stReq = new Test.SaveUserInfoReq();
    stReq.readFromObject({
        userinfo: {
```

```
uid,
    username,
    password,
    gender,
    tel,
    age
    }
});
proxy.saveUser(stReq).then(ret => {
        jsonWrite(res, ret.response.arguments.stRsp.toObject());
}, ret => {
        console.log('error');
});
});
```

6) 用户详细信息

```
// 用户详细
router.get('/getUserDetailForAd', (req, res) => {
    const { uid } = req.query;
    const stReq = new Test.QueryIdReq();
    stReq.readFromObject({
        uid
    });
    proxy.getUserDetailForAd(stReq).then(ret => {
        jsonWrite(res, ret.response.arguments.stRsp.toObject());
    }, ret => {
        console.log('error');
    });
});
```

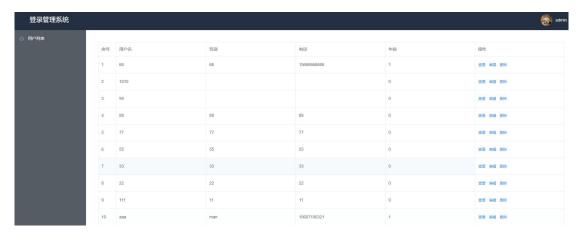

- 二、 设计界面,编写页面逻辑请求数据
 - 1. 登录

2. 注册

* 用户名称	请输入用户	中名称		
密码	请输入密码			
确认密码	请再次输入密码			
手机	请输入手机号			
*性别	请选择性别			~
*年龄	1		•	
	确定	取消		

3. 用户列表

4. 编辑

用户名称	66	
密码	清输入密码	
手机	15666666666	
* 性别	66 ~	
* 年龄	1 •	

5. 详情

用户详细信息	×
uid:66	
username:66	
password:	
gender:66	
tel:15666666666	
age:1	
createTime:2019-12-02 15:22:06	
updateTime:2019-12-02 15:22:06	

三、 明日计划

熟悉 dcache api,完成 dcache 操作
